

## **User Information According To Product Liability Act (§4ProdHG)**

### **Definition of Product**

Sliding door mountings are functioning parts responsible for changing the position of slidable elements. To achieve that, perpendicularly mounted wings of various materials are vertically moved at appropriate speed. They are constructions suspended from the top and are run on the floor.

### **Installation**

For installation, fitting instructions have to be followed, and care has to be taken that the whole substructure is able to carry the loading weight. Requirements given must not be exceeded. Influenced like direct effects of weather, aggressive corroding media or strong wind loads must at any rate be prevented, if the mounting has not been designed for them. Moreover, no additional forces must have effect on the mounting. Maximum loads and conditions can be looked up in the product documents or have to be asked for.

### **Operation**

All construction parts have to be used as required. In particular, care has to be taken that a floor guideway is installed with the route limited by stoppers. While in operation, too high and too low temperatures should be avoided. It has to be ensured that no foreign matter can find its way into the mounting. There must not be any obstacles in the opening area. Particular care has to be taken that no human beings or other living things might be injured through the movement. It must be possible at any time to interrupt the shifting of the wings. Any modifications on the mountings require the maker's approval.

### **Maintenance and Servicing**

As appropriate, all movable parts have to be checked for functioning from time to time. Faulty elements must be exchanged immediately. The testing persons are expected to have sufficient knowledge. Catalogues, brochures, offering documents as well as special installation and operating instructions are available to obtain this knowledge. All manufacturers are required to procure these documents and, after installation, to pass them on to the user.

For cleaning, only such cleansing agents may be used that do not affect the mounting.
